The coming acceleration of global population ageing

Wolfgang Lutz^{1,2*}, Warren Sanderson^{1,3*} & Sergei Scherbov^{1,2*}

The future paths of population ageing result from specific combinations of declining fertility and increasing life expectancies in different parts of the world¹. Here we measure the speed of population ageing by using conventional measures and new ones that take changes in longevity into account for the world as a whole and for 13 major regions. We report on future levels of indicators of ageing and the speed at which they change. We show how these depend on whether changes in life expectancy are taken into account. We also show that the speed of ageing is likely to increase over the coming decades and to decelerate in most regions by mid-century. All our measures indicate a continuous ageing of the world's population throughout the century. The median age of the world's population increases from 26.6 years in 2000 to 37.3 years in 2050 and then to 45.6 years in 2100, when it is not adjusted for longevity increase. When increases in life expectancy are taken into account^{2,3}, the adjusted median age rises from 26.6 in 2000 to 31.1 in 2050 and only to 32.9 in 2100, slightly less than what it was in the China region in 2005. There are large differences in the

population in age groups that have a remaining life expectancy of 15 years or less (see ref. 6 for the suggestion of a similar measure). If longevity increases, the minimum age of people included in Prop. RLE 15— increases. The adjusted version of the median age is called standardized or prospective median age (PMA)^{2,3}. It is the age of a person in the year 2000 who has the same remaining life expectancy as a person at the median age in the year under consideration. The change in the prospective median age over some time period is roughly the change in the median age minus the change in life expectancy at the median age.

The adjusted version of the average age is the population average remaining years of life (PARYL). It is the weighted average of age-specific remaining life expectancies, where the weights are the proportions of the population at each age^{7,8}. PARYL gives us the average remaining years of life of population members. Unlike the other measures, PARYL goes down as a population ages. We intuitively think of populations being younger when, on average, its members have more years left to live and PARYL is higher.

Indicators of Population Ageing

Conventional Indicators (Age defined as time since birth)

- Mean age: Arithmetic mean
- Median age: Age at which 50 percent of population are older/younger
- Proportion above certain age (60+, 65+, 80+)
- Old-age Dependency Ratio: (65+/20-64) or (60+/15-59) or (60+/20-59)
- Ageing Ratio: Proportion elderly to young e.g. (65+/0-19)
- Demographic Support Ratio: inverse of OADR, i.e. (20-64/65+)
- Economic Support Ratio: People actually working per people retired

New Indicators (considering remaining life expectancy)

- PMA: Prospective Median Age (Standardized for a certain year)
- Prop RLE 15 -: Proportion of the population at ages that have average remaining life expectancy of 15 years or less
- PARYL: Population average remaining years of life. Expected years to death of average person alive today.

Education Matters

- For individual income (Micro)
- For economic development (Macro)

“Whereas at the micro case ... it is established beyond any reasonable doubt that there are tangible and measurable returns to investment in education, such evidence is not as consistent and forthcoming in the macro literature “
(Psacharopoulos and Patrinos 2002)

Findings are dependent on education indicators chosen (mean years of schooling, for which age groups, distribution by attainment level) and quality (consistency across countries and time)

- For health/mortality and fertility
- Indirect effects of education on institutions and good governance

Education has multiple benefits also at different time horizons:

- It leads to lower child mortality, lower fertility and better health in the **short term**
- It leads to higher economic growth in the **medium term**
- It leads to more democracy and human rights in the medium to long term
- It leads to better health status of the elderly in the long term

POLICYFORUM

ECONOMICS

The Demography of Educational Attainment and Economic Growth

Complementing primary education with secondary education in broad segments of the population is likely to give a strong boost to economic growth.

Wolfgang Lutz,^{1*} Jesus Crespo Cuaresma,² Warren Sanderson³

Measuring Formal Education

- **Education Flows** – Policy variable
(Gross and Net Enrolment by Age, Repetition Rates)
- **Education Stocks** - Change very slowly due to great momentum
 - Mean years of schooling
 - Distribution by highest educational attainment
 - Functional literacy (IALS, LAMP)

Our four education categories for 2000

based on ISCED, from censuses and surveys (mostly DHS)

- **No education** Never been to school
- **Primary** Some primary, complete primary, incomplete lower secondary
- **Secondary** Completed lower secondary to incomplete first level of tertiary
- **Tertiary** Completed first level of tertiary or higher.

Alternative Education Scenarios to 2050

- **FT – Fast Track:** Universal Primary Education, 90% Junior Secondary, 60% some Tertiary
- **GET – Global Education Trend:** Improvements in education transition rates that follow global experience of past 30 years (driven by Asian experience)
- **CER – Constant Enrolment Rates:** Keep proportion in school constant over time.
- **CEN – Constant Absolute Enrolment Numbers:** No new places in school – while number of children grows.

New ERC Project

“Forecasting societies’ adaptive capacity to climate change”

Focus on differential vulnerability – Education as possible climate change adaptation policy

- Three empirical case studies: Sahelian Drought, Asian Tsunami and Hurricane Mitch
- Global level time series analyses
- A new “demographic theory of social change with predictive power”: Age – Period – Cohort changes.
- New “science based” population and education projections for all countries in the world. Assumptions based on broadly based evaluation of alternative arguments – large numbers of expert per region.
